## FOREWORD

The Battlefield Information Systems Technical Area of the Army Research Institute (ARI) is concerned with helping users and operators cope with the ever increasing complexity of the battlefield and automated systems by which they acquire, transmit, process, disseminate, and utilize information. Increased system complexity increases demands imposed on the human interacting with the machine. ARI's efforts in this area focus on human performance problems related to interactions with command and control centers and on issues of system design and development. Research is addressed to such areas as user-oriented systems, information management and display, decision support, and the impact of "high technology" on systems integration and utilization.

One area of special research interest involves the Soldier/Machine Interface. The ultimate aim of this area of research is to provide user-oriented functional specifications for a data management/display systems architecture of a generic SMI. That is, an SMI adaptable to multiple battlefield functional areas such as command/control, maneuver, armor, cavalry, artillery, combined arms, etc. The initial development is focused on increasing the operational effectiveness of commanders of small units, i.e., combat units that exchange fire with the enemy.

Research in the area of user-oriented systems is conducted as an in-house effort augmented through contracts with uniquely qualified organizations. The present effort was conducted in collaboration with personnel from Perceptronics, Inc., under contract MDA903-84-C-0219. The effort is responsive to requirements of Army Project 2Q263744A793, Human Performance Effectiveness and Simulation, and to special requirements of the U.S. Army Armor Center and School, Ft. Knox, Kentucky.

The following individuals contributed to the technical activities reported in this research note:

## 1. INTRODUCTION

### 1.1 Overview

The primary objective of Phase 1 of the current effort is to develop and evaluate a prototype "intelligent" soldier-machine interface (SMI) for commanders of small combat units. The general thrust is toward showcasing the ways that applied expert system technology can be used to reduce the tremendous cognitive burden imposed on combat commanders in the data-rich, highly stressful battle-field environment. The scenario developed to provide an early demonstration of some features of an "expert" enhanced SMI is a tank platoon movement-to-contact in which an ambush of an enemy force is executed. Expert protocols that manage/display selected information extracted from a digitized map data base are featured in this initial version.

### 1.2 Background

The need to develop and test innovative soldier-machine interface (SMI) unit commanders (company and below) is recognized by HQDA, TRADOC, and DARCOM. One focal point for R&D activities to meet this need is the V(INT)<sup>2</sup> (Vehicle Integrated Intelligence) concept. V(INT)<sup>2</sup> is an outgrowth of a recommendation made by the Army Science Board (summary 1981) and suggestions made by GEN Blanchard, GEN Otis, and others. In a parallel development, the Armored Vehicle Science and Technology Program Advisory Council has established a technology base initiated to provide "the system architecture for the total integration of ground vehicle electronic (Vetronic) systems within the integrated battlefield." The need for an optimum and standardized SMI is recognized as a prime requisite for improved system effectiveness within the Vetronics structure.

A major goal of the V(INT)<sup>2</sup> (and Vetronics) program is to provide small unit commanders (e.g., a tank platoon leader) with information products derived from "high technology." These information products now provide the data for computerized data management/display systems that supply large unit headquarters with real time information regarding friendly and enemy forces, terrain, and other aspects of tactical operations. However, because of recent advances in sensor, communication, and data processing technologies, battlefield data is produced at

volumes and rates that exceed the capacity of a small unit commander to absorb it. The solution is to provide data management/display systems that will tailor the amount, format, and level of detail of information to: (1) the needs of commanders at various echelons, and (2) the changing needs of a commander as the tactical situation develops.

A key element of a successful data management/display system is a properly designed SMI through which information is transferred by the commander to and from the machine (computer). The primary objective of the current effort is to create a research test bed for use in developing such an optimum interface. The purpose of this test bed, hereafter referred to as the ARI V(INT)<sup>2</sup> SMI Demonstrator, is to demonstrate a data management/display system that utilizes Expert Rule-Based (ERB) protocols to control the input/output of information. As used here, the term Expert Rule-Based protocols refers to any of the various types of interactive data management or decision aiding processes based on the application of artificial intelligence techniques. The purpose of the ERB protocols is to take advantage of the high rate of acquisition, transmission, and processing of battle-field data available via current electronic technology. Timely access to unit-relevant information will provide a force multiplier to small unit commanders in the future AirLand Battle and AirLand Battle 2000 environments.

The ARI V(INT)<sup>2</sup> SMI Demonstrator will provide a test bed for evaluating alternative approaches to incorporating flat panel displays, voice input of commands, interactive input/display screens, multi-function control panels, synthetic voice alarms/instructions, Expert Rule-Based protocols, decision aids, and other candidate applications of "high technology" to the Soldier/Machine Interface (SMI). By providing a dynamic, graphical interface along with integrated voice inputs/outputs and multifunction control panels, the ARI V(INT)<sup>2</sup> Demonstrator will enable measurement, in realistic man-in-the-loop tests, of the increase in operational effectiveness that can be expected from the innovative data display/management concepts envisioned by the Army, DoD, and the scientific/industrial communities. These tests will provide objective data based on user performance, reaction, and acceptance, that will enable systems designers and proponents to assess the potential improvements in operational effectiveness that could result from the incorporation of candidate hardware/software features in the

soldier/machine interface of future tactical systems. Initial efforts will focus on tank operations. However, the language goal is to develop a simple user-tested SMI architecture adaptable to the needs of small unit commanders of a broad spectrum of combat and combat support elements (infantry, artillery, armor, cavalry, combined arms, etc.)

### 1.3 Situational Context

It is D+8, and the AirLand Force Charlie (ALF Charlie) is reorganizing in the vicinity of Treischfeld (NB 630233). Fighting has been fierce and although the enemy's attack has been broken, own force resources are limited. Recent activity indicates that the command and control structure of the enemy has disintegrated. Battle tactics are not following doctrine. Small unit engagements are common as isolated enemy forces attempt to relocate parent units.

VISTA assets have just reported a communications intercept of an enemy radio transmission emanating from the vicinity of Morsberg (hill 466, vic NB 611186). The caller identified his force as four T-88 tanks and two infantry fighting vehicles, and their objective as the city of Geisa (vic NB 673187).

A platoon from Bravo Company of the 1st Battalion, Regiment 3, AFL Charlie, is located on the outer perimeter of the ALF's current position (vic NV 651228). This platoon is equipped with V(INT)<sup>2</sup> and the Tank Platoon Leader (TPL) has just confirmed his unit location, mission status, and readiness.

The next major concern of the TPL is to determine where an ambush operation can be successfully performed given the current path of the enemy, the most likely/expected enemy behavior, and the prevailing situational constraints (e.g., terrain, enemy strength, expected speeds, direction of movement, expected terrain trafficability for the enemy and friendly unit, and expected enemy tactics). If a specific location for ambush is found, the TPL undertakes the ambush operation. If no ambush is found, given specific situational constraints and enemy capabilities, the TPL has to make a rapid assessment whether ambush operations can be abandoned. If it turns out that an ambush operation **has** to be performed, then the TPL may systematically relax constraints by, for example, increasing the area in which ambush operations are to be performed or selecting a more detailed map for analysis until a viable ambush point is identifiable.

#### **1.4 The Soldier-Machine Interface Concept**

The initial demonstration of the soldier-machine interface will feature a multiwindow display along with the following input media:

- Voice
- Graphics tablet
- Joystick/Handgrip devices
- "Soft" function keys (e.g., 5 x 4 bank of "smart" switches from micro-switch)

Four separate displays or four display windows created on a single display will be configured to present the following information:

- (1) Command Display for viewing textual alert/alarm messages or composing formatted messages (for example, tactical message viewing/composition and selective call-up of information related to the objective, operation mode, or the target).
- (2) World View Display consisting of external sensor information overlaid on map background. The area covered in these displays will be compatible with battalion-wide or brigade-wide levels of interest.
- (3) Close-in View Display consisting of map background covering the immediate area of interest to the platoon leader (3 km) with graphic overlays consisting of battlefield information such as ambush location, immediate avenues of approach, cover and concealment, and trafficability, etc.
- (4) Computer-Generated Imagery (CGI) or Status Display (no video) showing own vehicle and platoon status or tactical situation (at various levels of abstraction) in terms of intercept geometries, and windows of opportunity (present and predicted) for ambush operations.

#### **1.5 Expert Rule-Based (ERB) Protocol Development**

The tactical scenario segment selected for the initial demonstration offers a few distinct situations for ERB protocol development. These include determining the ambush point, finding an intercept path to the ambush point, and selectively relaxing constraints to find one or more ambush points if none were found on the

initial pass. The ERB protocols will be supported by digital terrain data files and inputs from scenario generator/event sequencer. The terrain (elevation and feature) analysis routines will first be established to generate processed tables of (1) line of sight, (2) intervisibility, and (3) trafficability for the given 10 x 10 km area. Time-varying object data files including target, own vehicle profile, objectives, and friendly and enemy tactics will be constructed. In support of the tactical situation display related to ambush mode protocol, the subfunctions (rules or algorithms) shown in Table 1 will be derived.

TABLE 1  
SUBFUNCTIONS OF  
AMBUSH MODE PROTOCOL

- Projection of friendly and enemy routes/trajectories
- Presentation and updates of masking and concealment
- Projection of interception points/paths
- Identification of hull defilade positions
- Prediction of the line-of-sight
- Projection of target servicing opportunity window
- Evaluation of constraints/criteria relaxation

## **2. GENERAL FEATURES OF THE PROJECT**

## V(INT)<sup>2</sup> CONCEPT

- Close combat vehicle commander's interface with:
  - Vehicle's modular subsystems
  - Battalion--outside world
- Focus on providing information and intelligence
  - At the appropriate time and place
  - In the proper sequence, format, and priority
- Onboard computer employs AI software packages based on expert systems technology

## V(INT)<sup>2</sup> PROGRAM OBJECTIVES

- DEVELOPMENT OF:

- V(INT)<sup>2</sup> SMI demonstration facility and prototype work station
- A scenario that encompasses simulated inputs from downlinked data sources
- Expert rule-based (ERB) protocols for information management and decision aiding
- Human-related performance measures that impact battlefield effectiveness
- Measures for assessing impact of ERB protocol-augmented human performance on battlefield outcomes
- Functional specifications for operational data display/management system

- EXPLOITATION OF:

- "Force Multiplier" potential of high technology

## THE DRIVING TECHNOLOGIES

- APPLIED AI AND EXPERT SYSTEMS TECHNOLOGY

- Expert rule-based protocols for data fusion, manipulation, display
- Intelligent interfaces

- VOICE INPUT/OUTPUT AND PROGRAMMABLE SMI CONTROL PANEL

- Voice recognition/synthesis
- "Soft" function keys/touch panel, other

- INTERACTIVE VIDEODISC

- Background for graphics overlay
- Micro-controlled

- COMPUTER GENERATED IMAGERY AND HIGH RESOLUTION GRAPHICS

- Color
- Multiple windows
- Line-of-sight, trafficability, intervisibility

## **DEMONSTRATION FACILITY AND PROTOTYPE WORK STATION**

- From bench system to functional prototype
- Emphasis on selective fidelity
- Focus on user involvement/input
- Reconfigurable architecture
- Evaluation of alternative soldier-machine interface option, expert rule-based protocols, and display layouts

## FEATURES OF THE APPROACH

- Human factors analyses and studies in parallel with prototype development
- Operational fixed prototype of the SMI work station
- Added task to guarantee success of our technology transfer plan
- Adoption of an initial "strawman" prototype design

## THE SCENARIO: SETTING AND FUTURE CAPABILITIES

- Based on AirLand Battle 2000/Army 21 environment
- Simulated communications links to VISTA/DC<sup>3</sup>I
- Simulated inputs from commander's independent thermal viewer (CITV)
- Simulated inputs from remotely-piloted vehicles equipped with FLIR and low light level TV

## **BACKGROUND: GENERAL SITUATION**

- **HOSTILITIES INITIATED:**

- Fulda Gap, West Germany
- U.S. mission--security operation

- **RATIONALE:**

- Area of U.S. Army interest
- Security operation allows multi-mission possibilities
- Digitized Fulda Gap terrain is readily available

## **SPECIFIC SITUATION**

- **UNIT LEVEL:**

- Platoon (4 tanks)

- **MISSION:**

- Move to a preestablished blocking position

- **SITUATION:**

- Precipitates engagement
- Engagement facilitates ambush opportunity

- **RATIONALE:**

- Manageable number of participants
- Realistic mission assignment
- Requires action
- Identifies key events
- Isolates required activities
- Suggests display type(s) and associated information requirement(s)
- Indicates potential AI/expert systems application area

## PROGRAM PRODUCTS

- CONCEPTS, TECHNOLOGIES, AND SYSTEMS THAT WILL PROVIDE:
  - A "force multiplier" on the battlefield
  - **Through** performance enhancement of the soldier working **with** his equipment **in** the unit
  
- SPECIFICATIONS FOR A DATA DISPLAY/MANAGEMENT ARCHITECTURE
  - Utilizing state-of-the-art in applied AI and man-machine interface technology
  - Adaptable to multiple battlefield applications

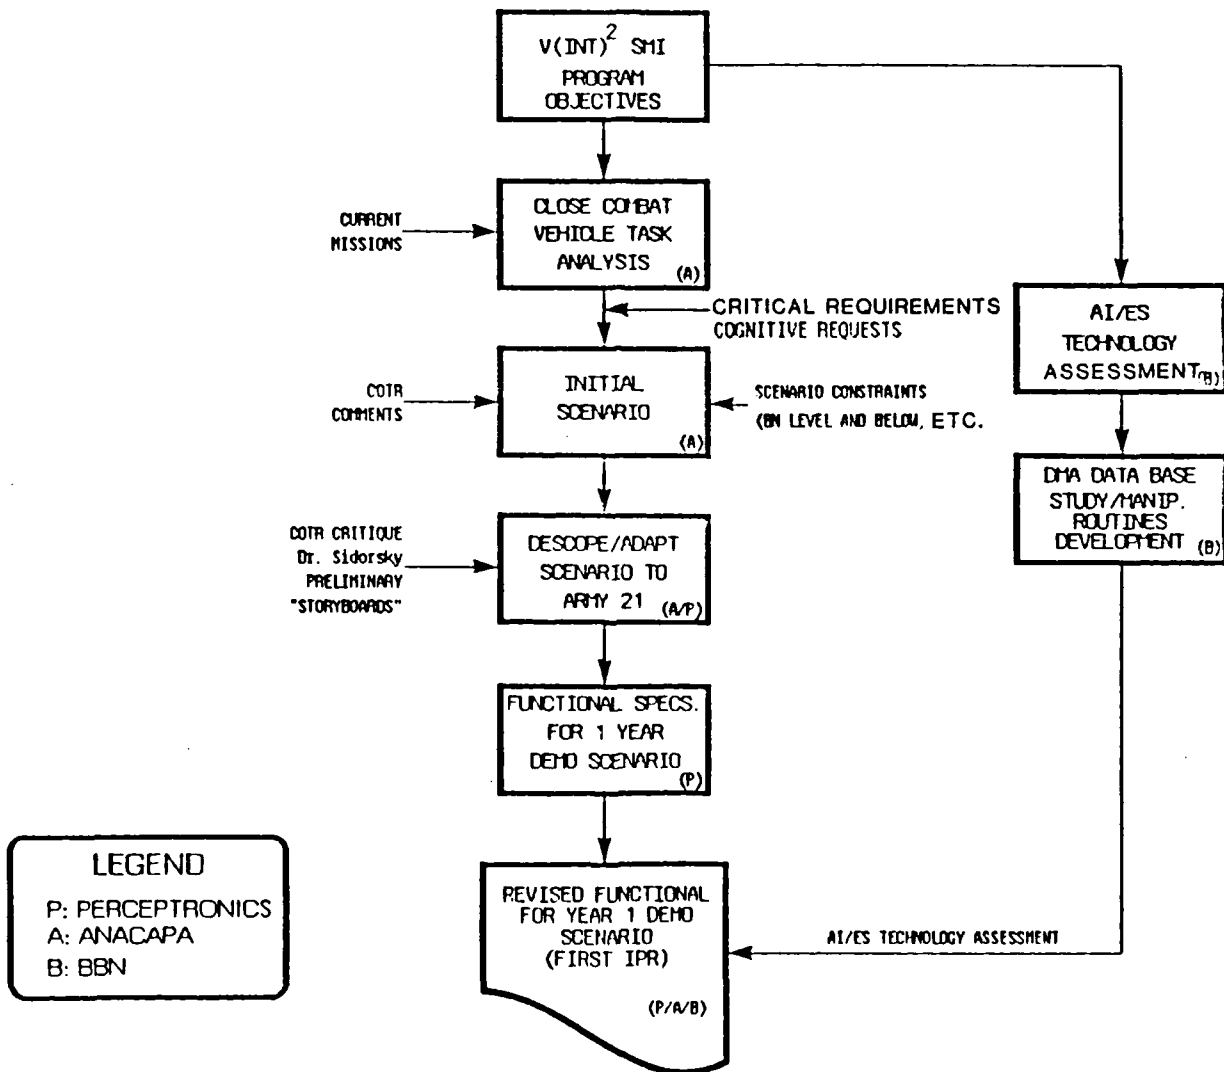

### 3. PHASE I ACTIVITIES

## PHASE I APPROACH

## PHASE I ACCOMPLISHMENTS

### TASK 1A

- C<sup>2</sup> information requirements/task analyses completed
- Critical cognitive tasks identified

### TASK 1B

- Prototype work station "mockup" designed and fabricated

### TASK 1C

- Detailed demonstration scenario analyzed
- Man-machine interactions identified
- Refinements/recommendations summarized
- Opportunities for ERB protocol development identified
- V(INT)<sup>2</sup> SMI architecture for demonstration scenario specified

### TASK 1D

- ERB support software partially developed
- DMA data base manipulation routines partially completed

### TASK 1E

- Voice (i.e., VOTAN), PDP switches, and Beetle cursor controller integrated with symbolics
- Voice, PDP switches, and Beetle cursor controller demonstrable with scenario script

### TASK 1F

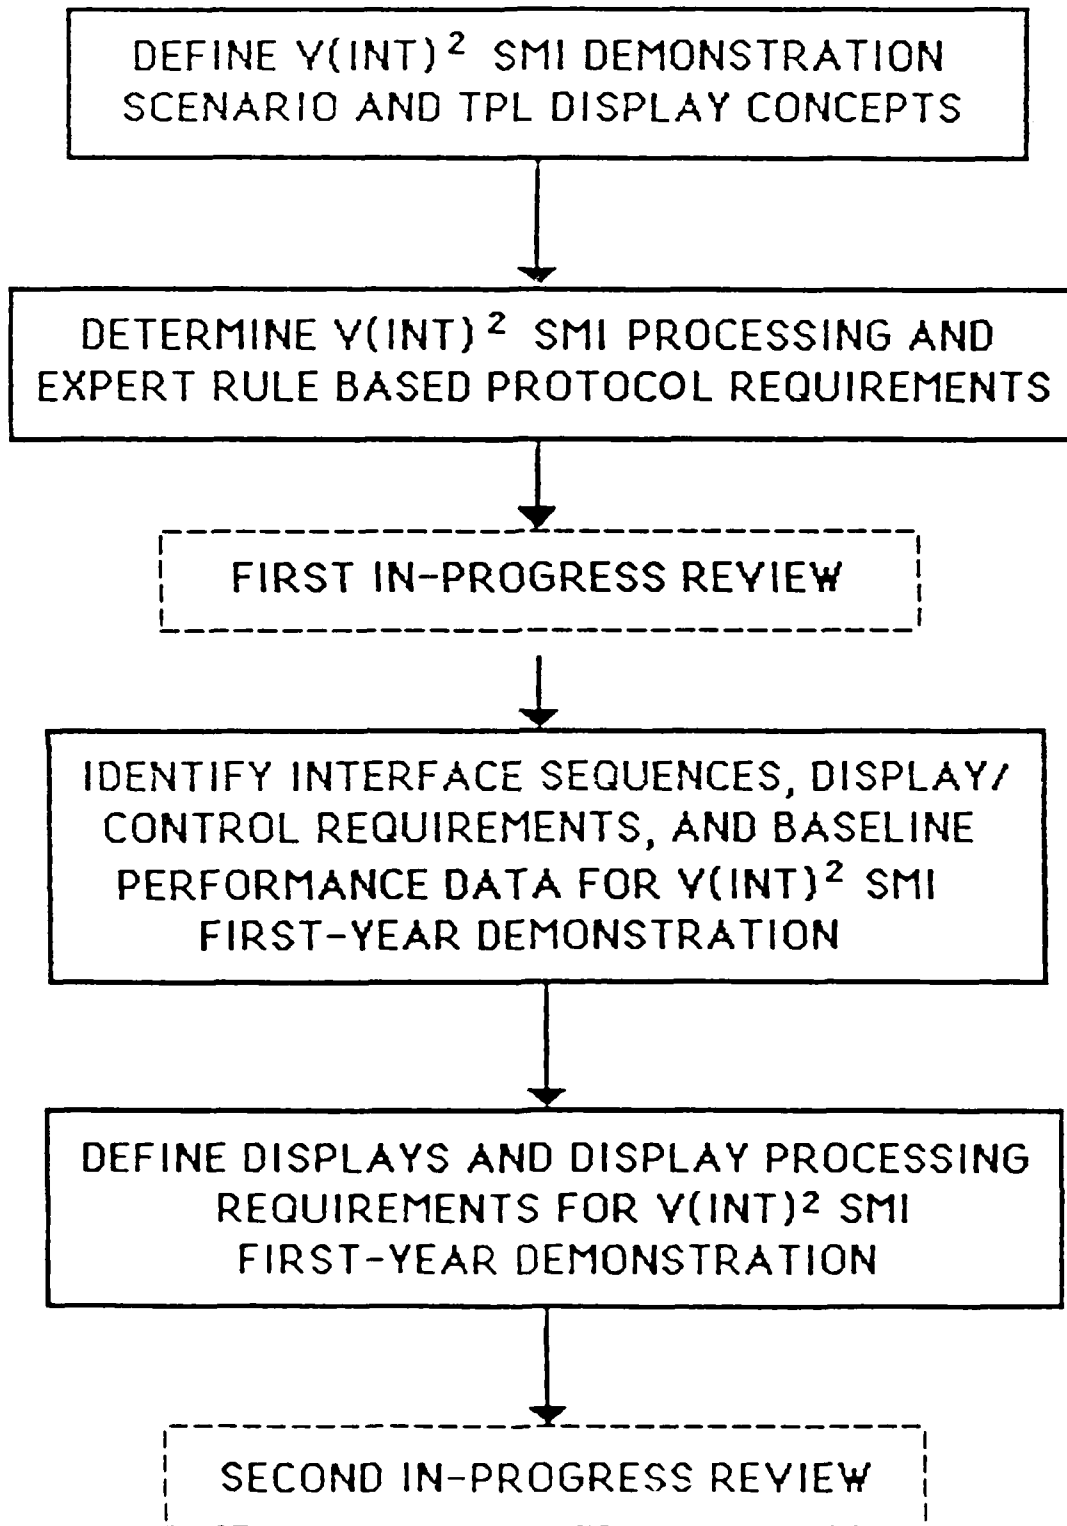

- Performance-based approach for demonstrator evaluation partially defined

### TASK 1G

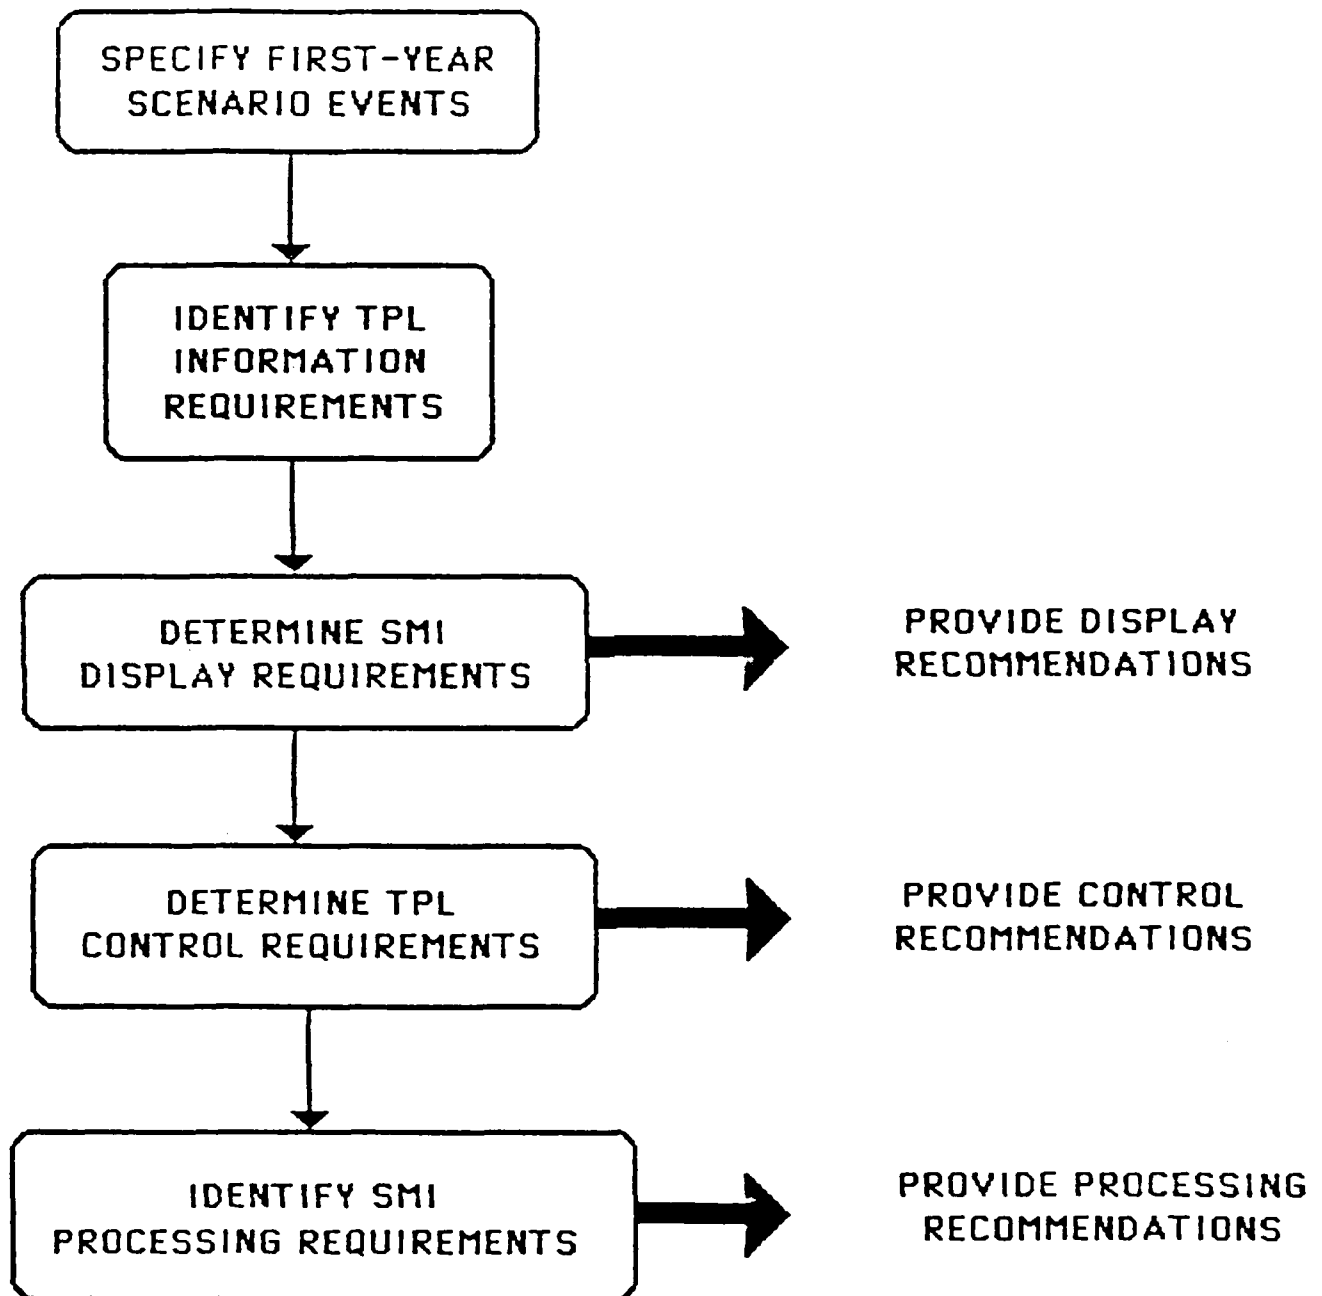

- Demonstration script reconciled with "big picture"
- User community involvement initiated for successful technology transfer

TASK 1A: Task Analysis of Armor Operations

**ANACAPA ACTIVITIES**

## ANACAPA FIRST-YEAR DEMONSTRATION SCENARIO DEVELOPMENT STRATEGY

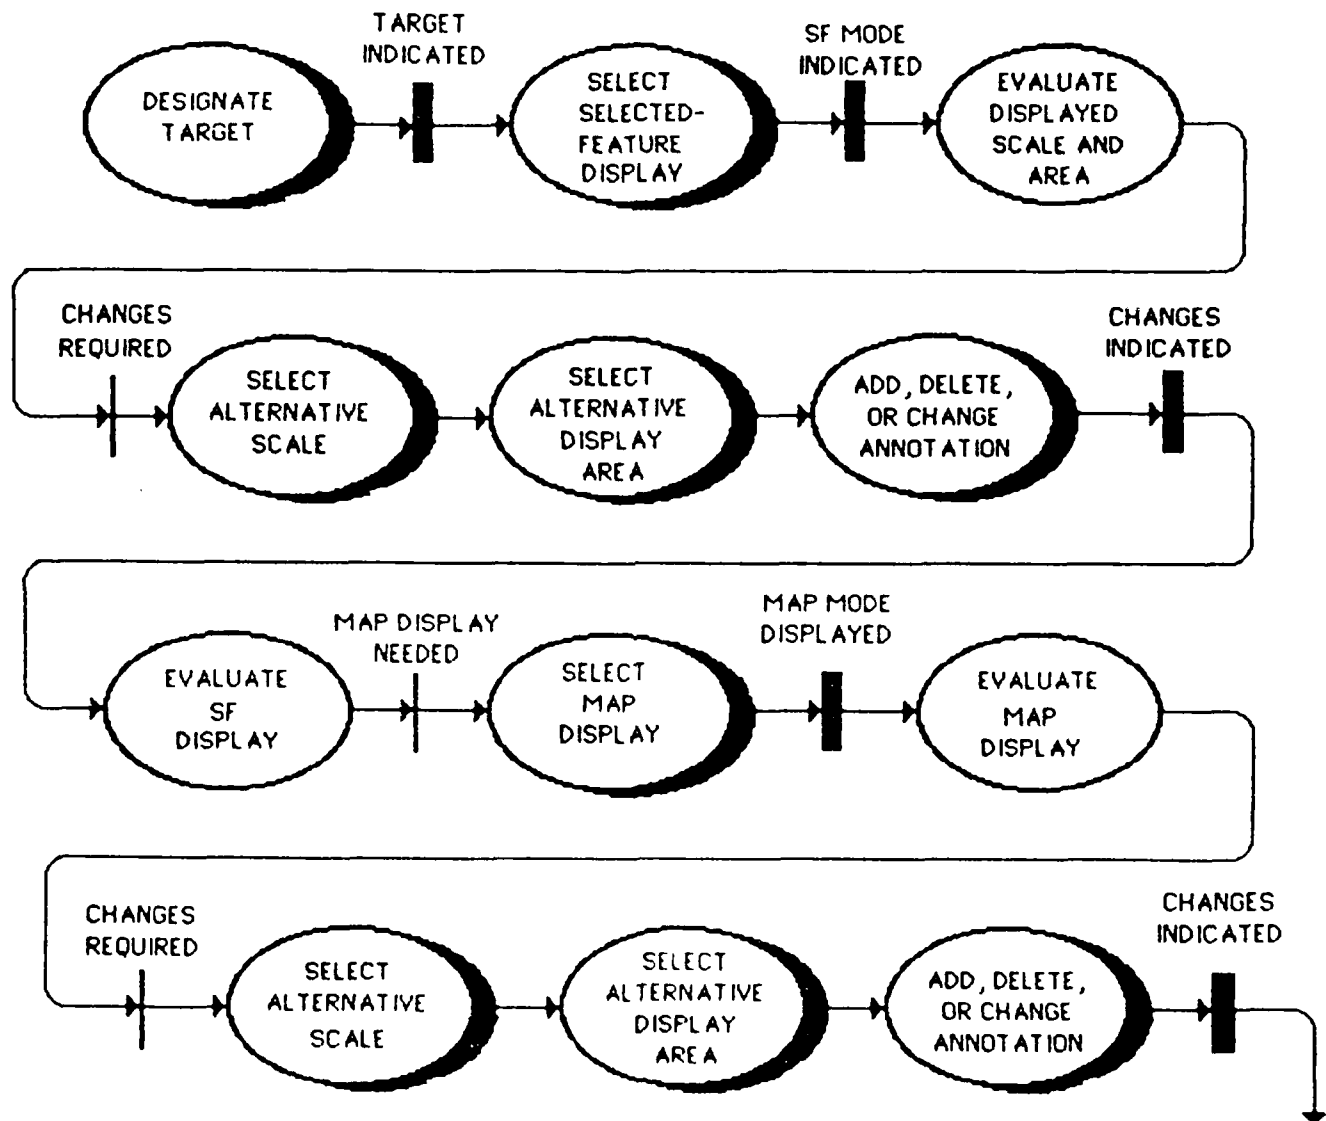

## **TPL INTERFACE SEQUENCES FOR SMI FIRST-YEAR DEMONSTRATION**

1. Enter or modify information on **LOCAL CONDITIONS**
2. Acknowledge receipt of **FRAGO** from company commander designating target and specifying intercept action
3. Put system in **INTERCEPT MODE**
4. Assess **TARGET SITUATION**
5. Project probable **TARGET ROUTE**
6. Select **TARGET ROUTE INTERCEPTION SEGMENT**
7. Select **AMBUSH SITE** from possible alternatives
8. Select **OPTIMUM ROUTE** to ambush site
9. Project **TARGET SERVICING WINDOW**
10. Issue **FRAGO** to platoon for movement to ambush site
11. **ADVANCE** to ambush site
12. Determine **FIRING SECTOR** for the platoon
13. Issue **FRAGO** specifying **FIRING SECTOR** for the platoon
14. Issue **FIRE COMMAND** when the target enters the target servicing window

## EXAMPLE OF SEQUENCE ANALYSIS

### Sequence 4: Assess Target Situation

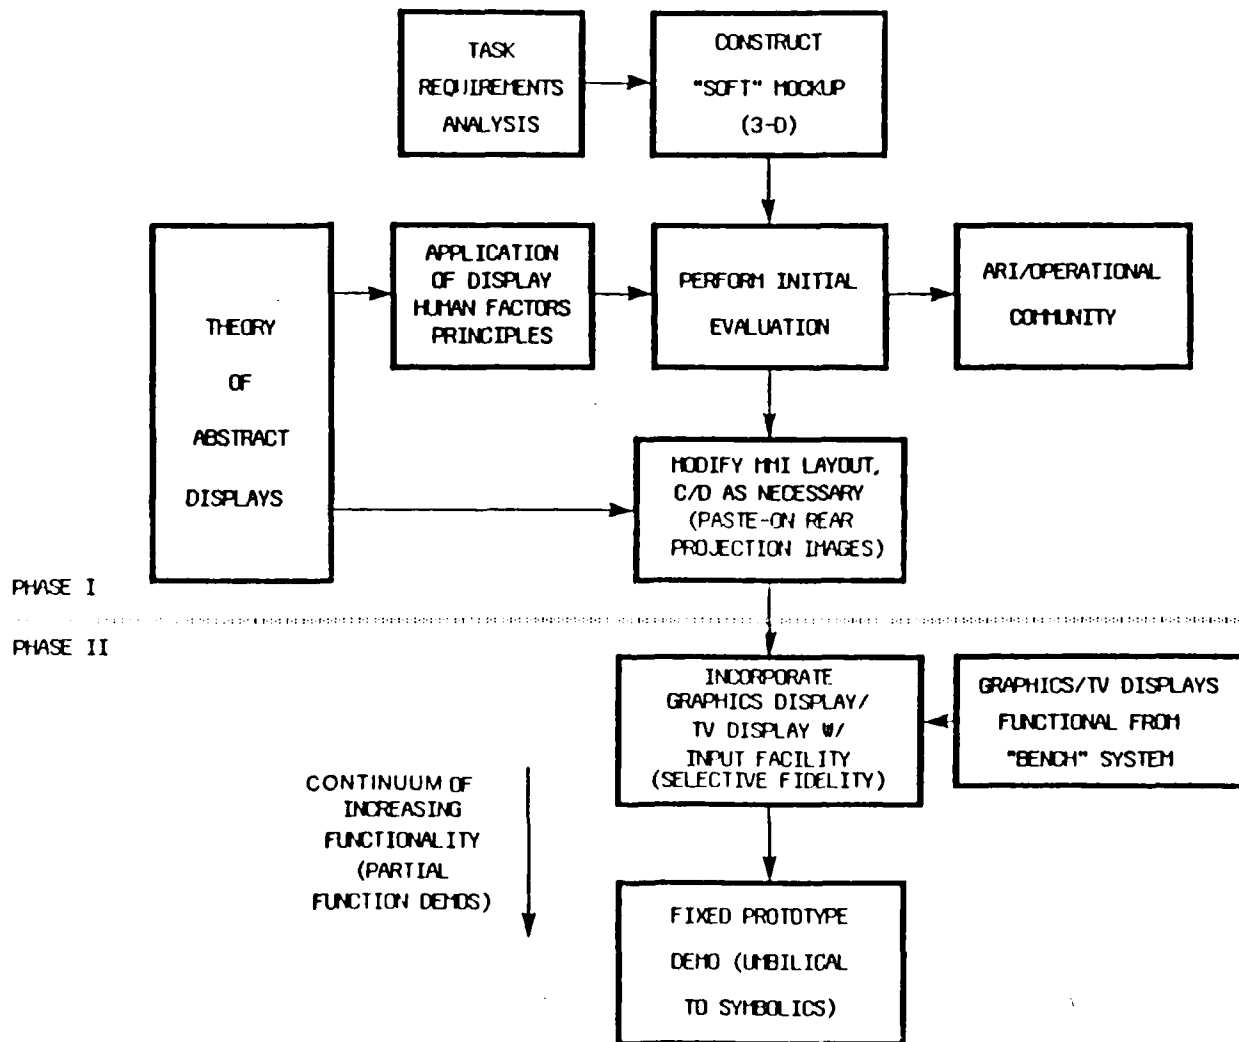

**TASK 1B: DESIGN WORK STATION**

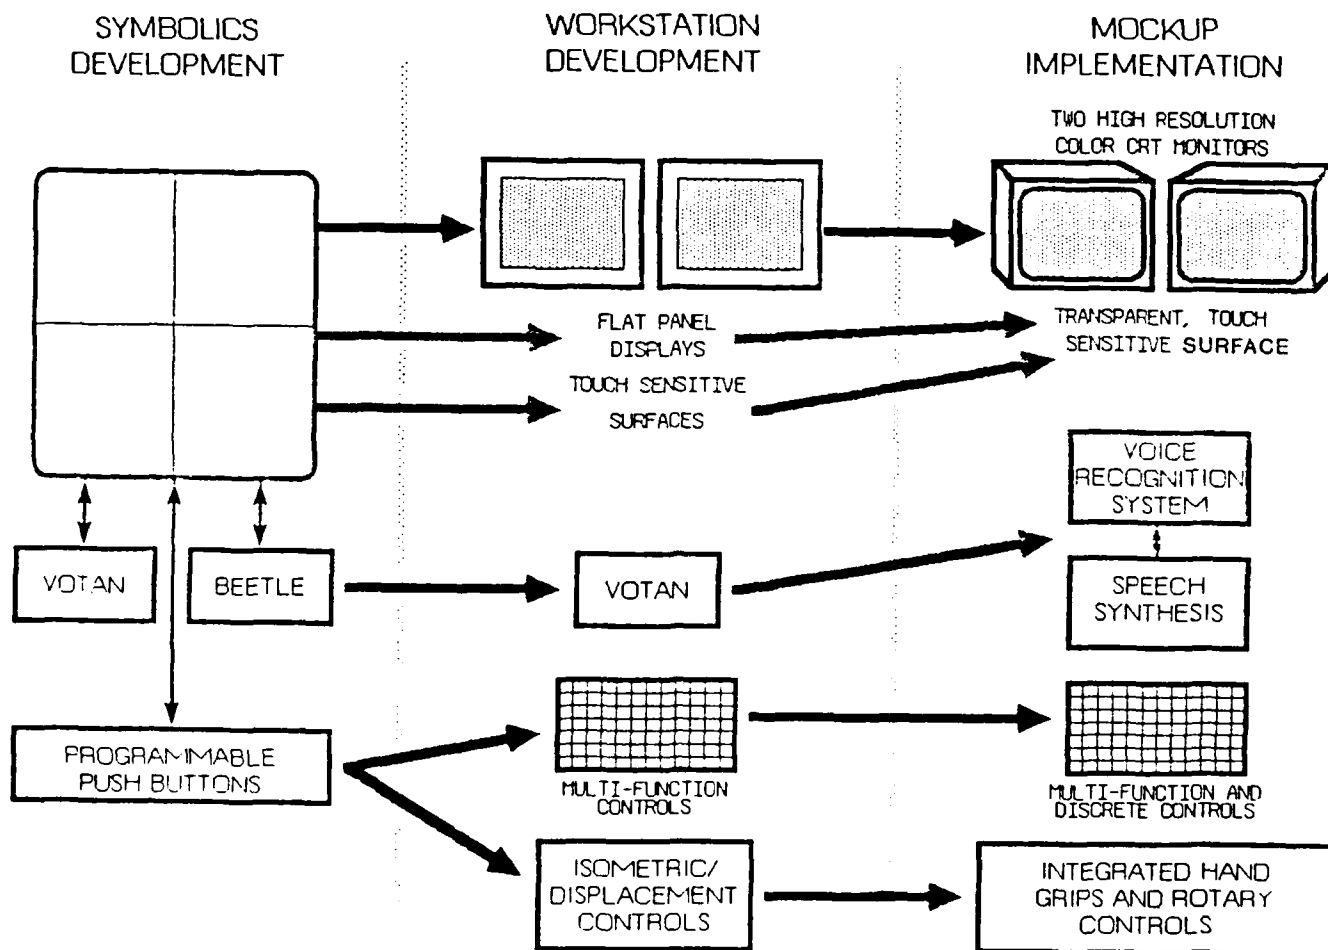

**DESIGN WORK STATION**

- **MOCKUP CONSTRUCTION**
- **MOCKUP DEVELOPMENT**
- **CONTROL AND DISPLAY HARDWARE  
CONFIGURATION**
- **SYSTEM INTEGRATION**

## MOCKUP DEVELOPMENT

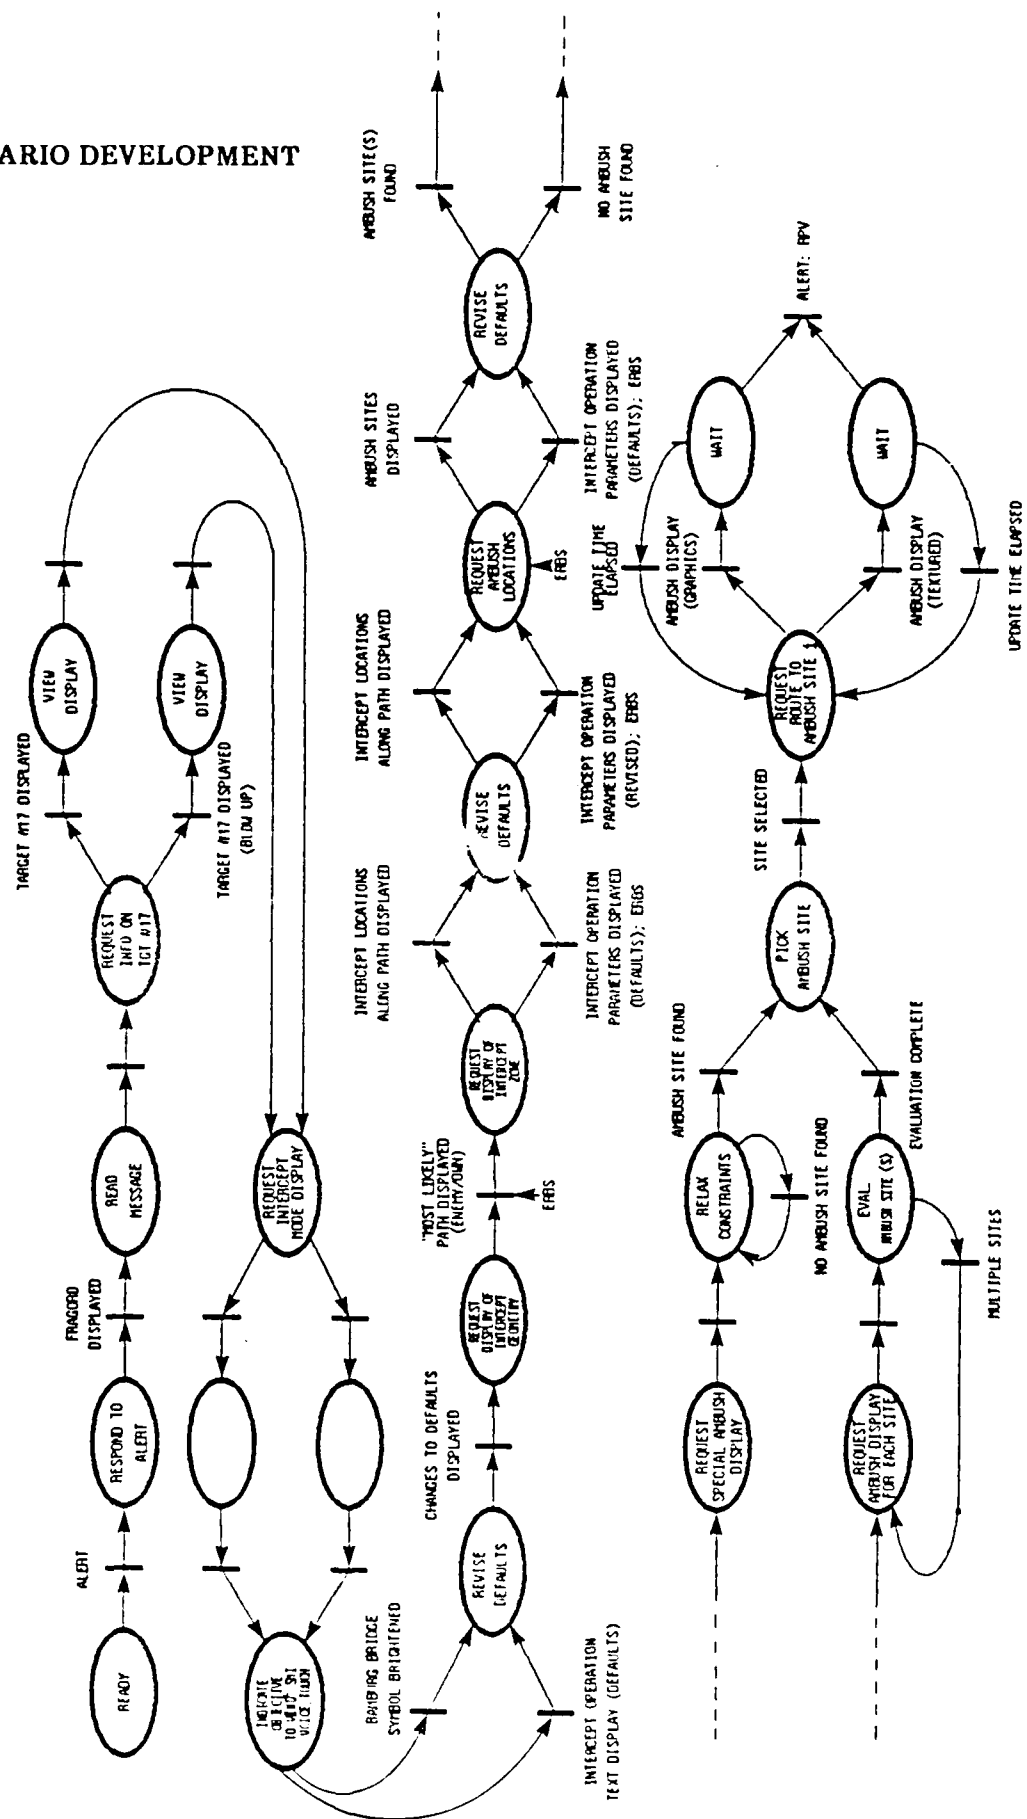

## CONTROL AND DISPLAY HARDWARE CONFIGURATION

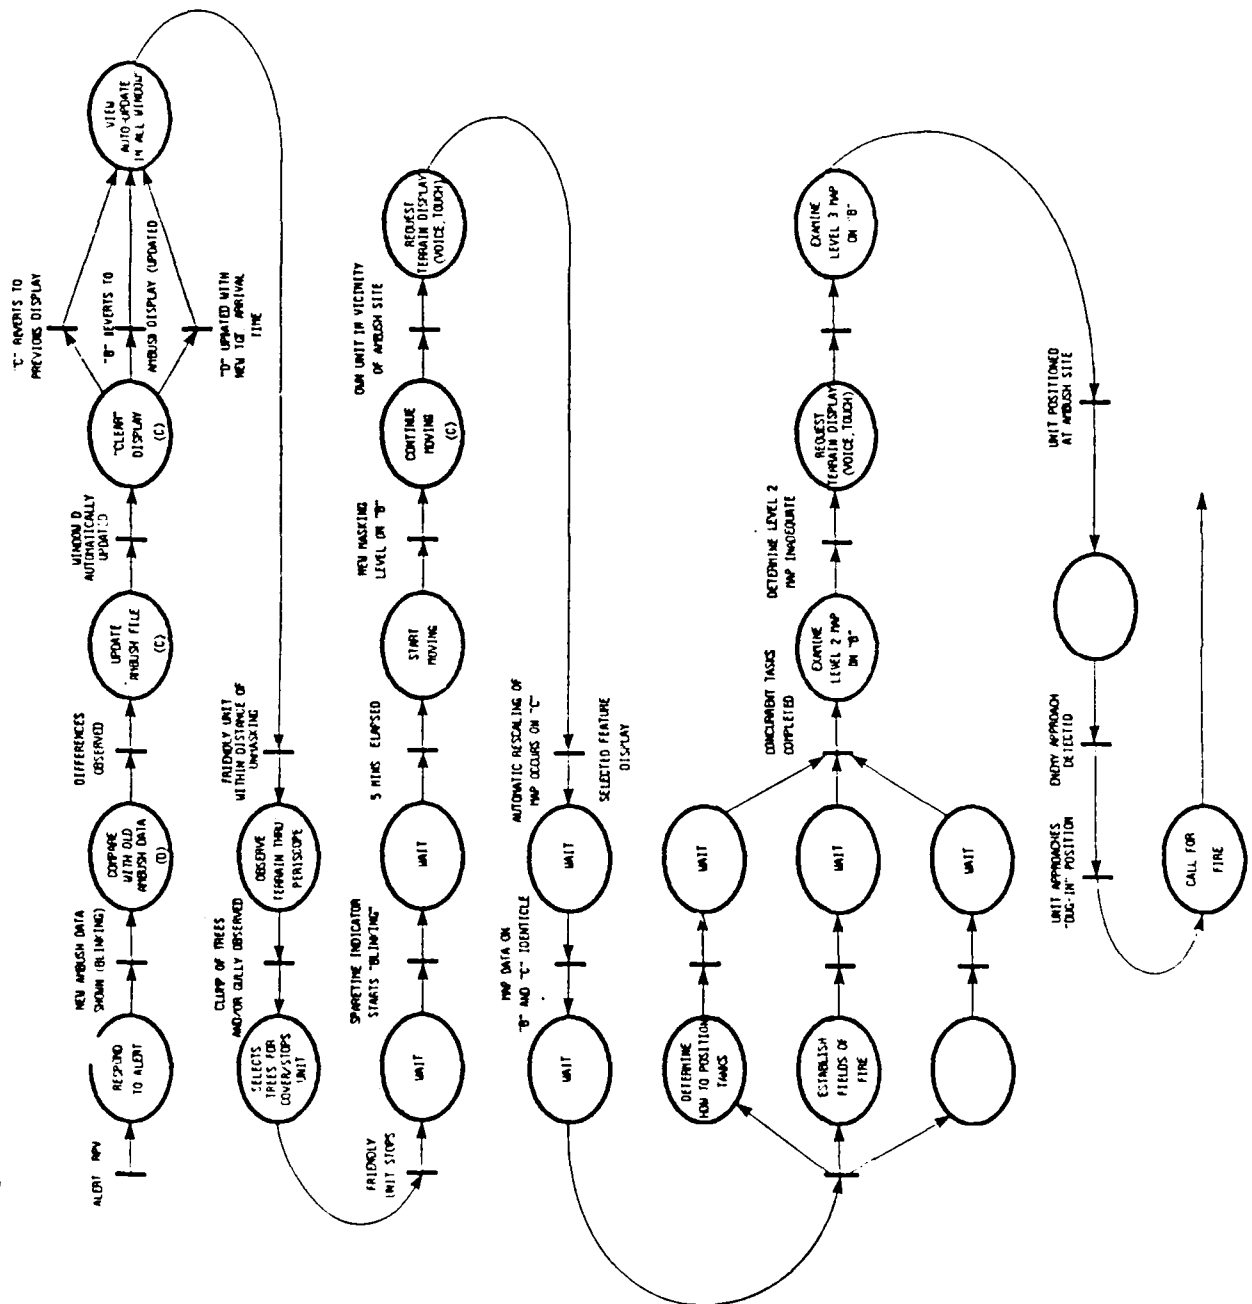

## SYMBOLICS INTERFACE OPTIONS

- OPTIONS
  - SERIAL
  - MULTIBUS
- CURRENT CONFIGURATION HAS 3 SERIAL  
(1 USED BY KEYBOARD)
- NEW BOARD WILL HAVE 4 SERIAL AND  
1 MULTIBUS

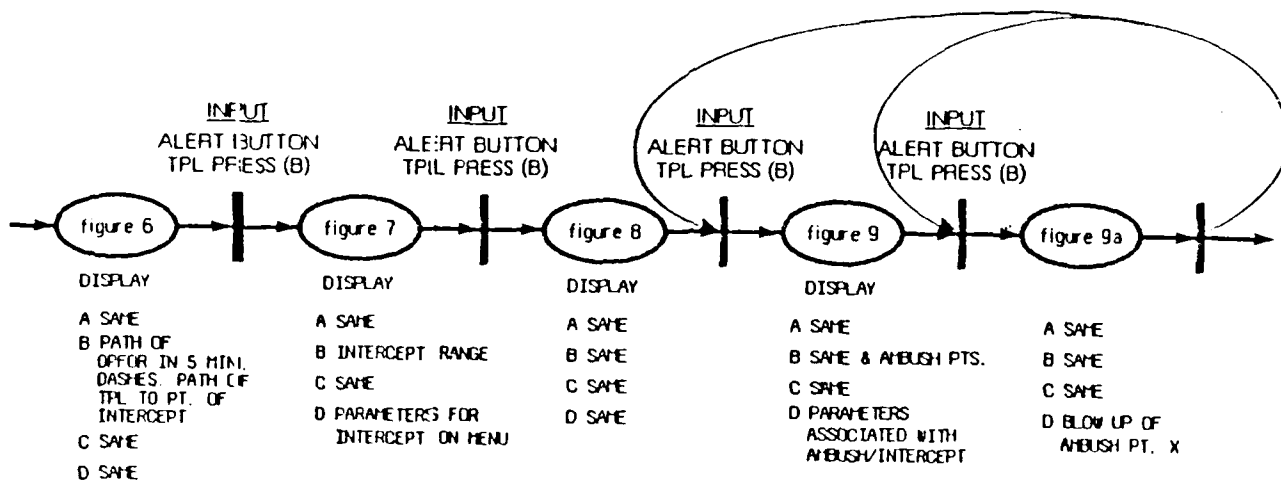

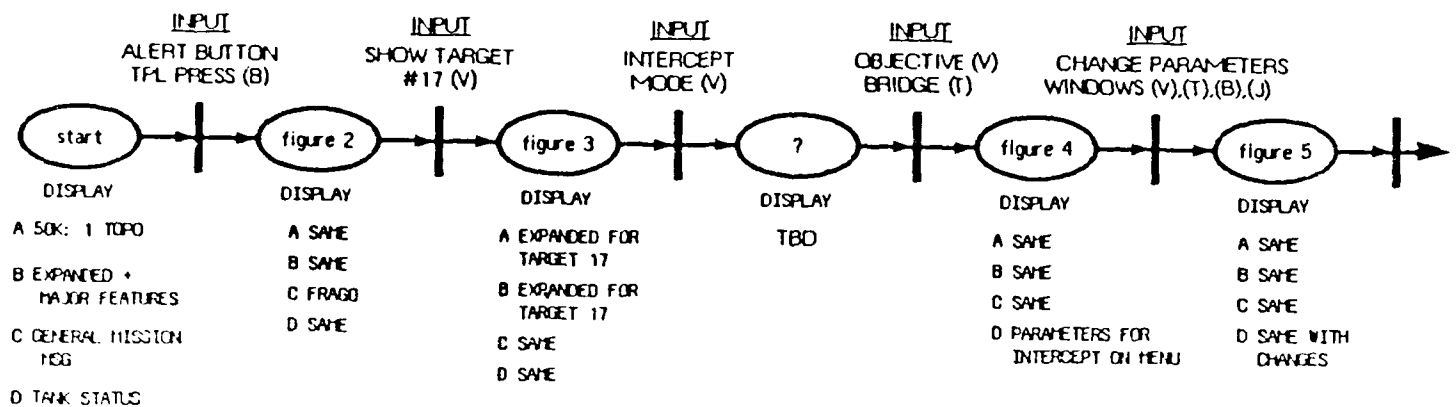

### TASK 1C: SCENARIO DEVELOPMENT

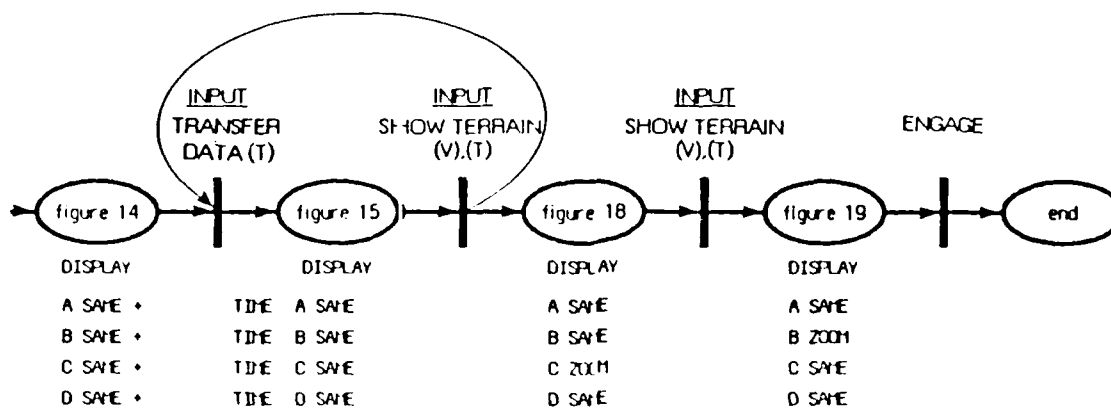

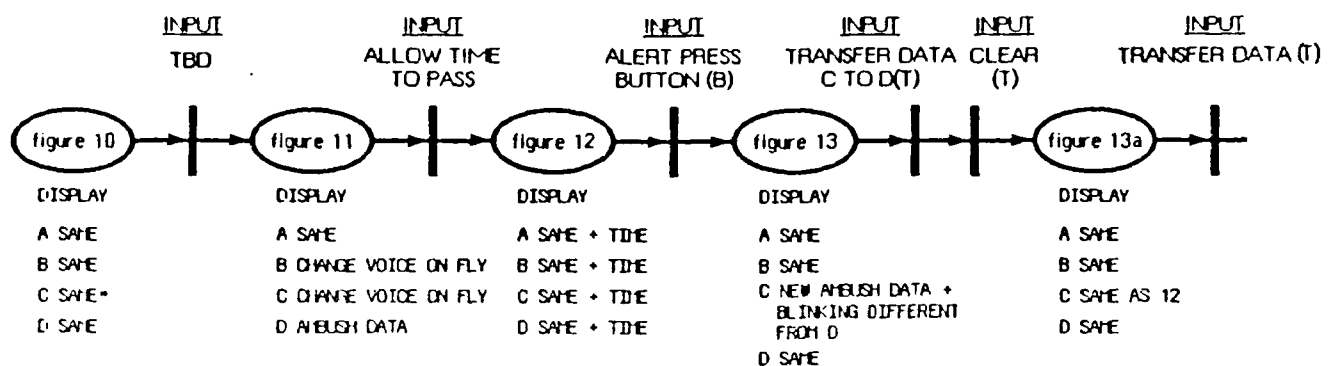

# PHASE I DEMO SCENARIO ACTIVITY SEQUENCE (FROM TPL VIEWPOINT) (CONT'D)

# V(INT)<sup>2</sup> STATE MACHINE

## V(INT)<sup>2</sup> STATE MACHINE (CONT'D)

## FIRST YEAR DEMONSTRATION

### ENEMY(GENERAL)

- OFFENSIVE BROKEN
- C<sup>3</sup> DISRUPTED
- TACTICS NOT FOLLOWING DOCTRINE
- UNITS SCATTERED
- ATTEMPTING TO RELOCATE OWN FORCES

### ENEMY(SPECIFIC)

- REMNANT OF A LARGER UNIT
- 4X T88 AND 2X BMPX LOCATED  
VIC RASDORF BY VISTA COMINT
- PLAIN VOICE TRANSMISSION WITH  
CALLER IDENTIFYING GEISA (VIC NB 673 187)  
AS OBJECTIVE

### FRIENDLY

- OWN FORCES ARE LIMITED
- ECONOMY OF FORCE PRIMARY TO  
OWN FORCE ALLOCATION DECISIONS
- VISTA ASSETS OPERATIONAL
- V(INT)<sup>2</sup> SUPPORT AVAILABLE TO  
THE TANK PLATOON UNIT LEVEL
- TANK PLATOONS IN FUTURE DOCTRINE  
MAY CONDUCT PURSUIT / INTERCEPT  
AND AMBUSH OPERATIONS

## SCENARIO

## V(INT)<sup>2</sup> SCENARIO

- SPECIAL SITUATION:

1. VISTA ASSETS HAVE REPORTED ELEMENTS OF  
AN ENEMY FORCE MOVING ACROSS THE  
INTERNATIONAL BORDER
2. COMINT ASSETS INDICATE THE ENEMY FORCE  
MISSION IS TO SECURE A BRIDGE CROSSING
3. UPDATES FROM VISTA ASSETS PROVIDE STRENGTH,  
COMPOSITION, PROBABLE ROUTE AND MOVEMENT  
SPEED OF ENEMY FORCE

## V(INT)<sup>2</sup> SCENARIO (CONT'D)

- SPECIAL SITUATION: (CONTINUED)
  - FRIENDLY ELEMENT FOR FIRST-YEAR DEMONSTRATION IS PLATOON-SIZED
  - FRIENDLY MISSION IS TO ENGAGE THE ENEMY FORCE PRIOR TO THE ENEMY REACHING ITS OBJECTIVE (AMBUSH)
  - NO SUPPORTING ARMS WILL BE EMPLOYED IN THE FIRST-YEAR DEMONSTRATION
  - ADVANCES BY FRIENDLY AND ENEMY WILL BE AXIS-LIMITED (ONE AXIS)
  - INITIAL POINTS, OBJECTIVE AND MISSION WILL REMAIN THE SAME FOR THE FIRST-YEAR DEMONSTRATION
  - SEE ARI RESEARCH NOTE 85-27 FOR DETAILED DESCRIPTION OF THE "AMBUSH" SCENARIO

    1. TARGET PATH PROJECTION GIVEN TARGET'S INITIAL AND FINAL POINT
    2. GIVEN PROJECTED TARGET ROUTE AND SPEED, FIND A SET OF LOCATIONS ALONG TARGET ROUTE THAT SATISFY: OWN PATH FINDING; OWN ARRIVAL TIME < TARGET ARRIVAL TIME
- KNOWLEDGE MANAGEMENT
  - A META-KNOWLEDGE SOURCE IN CONTROL OF UPDATING AND INTEGRATING MULTIPLE KNOWLEDGE SOURCES
- AMBUSH OPERATION
  - A COLLECTION OF FACTS, ROEs AND CRITERIA RELATED TO AMBUSH OPERATION
- DISPLAY MANAGEMENT
  - A COLLECTION OF RULES RELATED TO OPERATOR INPUTS, CURRENT CONTEXT AND TIME THAT UPDATE VARIOUS DISPLAY WINDOWS AS NEEDED
  - RESPOND TO OPERATOR INPUTS, ELAPSED TIME, AND ONGOING TASK

## TASK 1D: DEVELOPMENT OF ERB PROTOCOLS

### GOAL

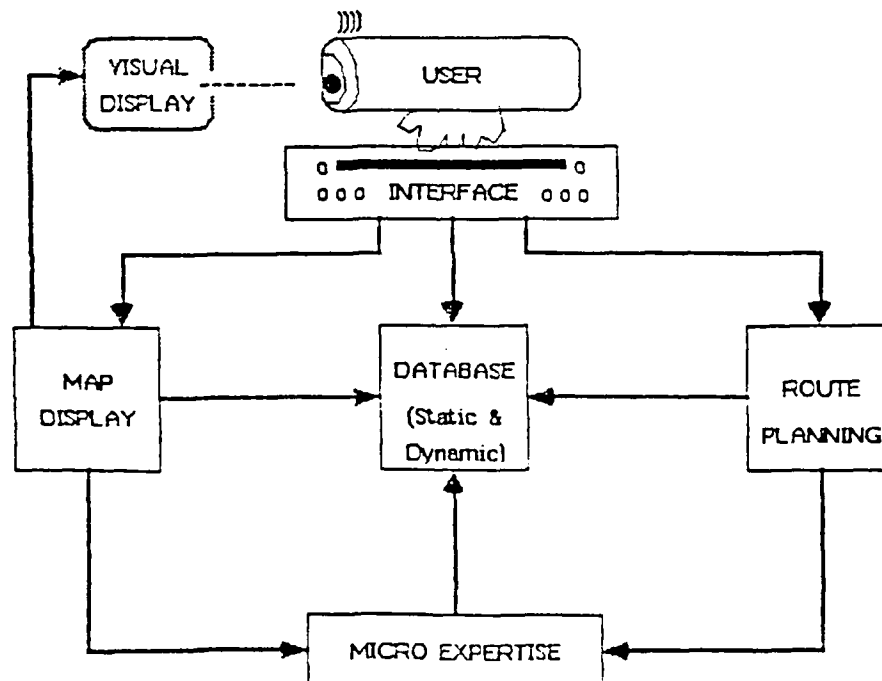

To assist TPL in planning a successful ambush by providing:

color-coded terrain maps

visibility, concealment, defilade  
and angular sector of fire

projected routings for friend  
and foe

### SCHEMATIC OF V(INT)<sup>2</sup>

## DECEMBER 1 MILESTONES

- store, retrieve, manipulate and display DMA database
- compute line of sight from enemy positions
- identify and depict regions of selected trafficability

## CURRENT COMPONENTS

- Map display and database
- Line of sight visibility (micro expertise)
- Route planning

## CURRENT VINT2 MAP DISPLAY

- data extraction
- color-coded background displays
- contouring
- overlays
- perspective view

## DATA EXTRACTION

- DMA data = 64 bits per location as sets of bit fields
- initial data had bugs, some removed by simple filtering
- can retrieve any contiguous bit field and associate values with colors

## COLOR-CODED BACKGROUND DISPLAYS

- 5 bits allows 32 color shadings
- 3 mutually exclusive displays
  - terrain elevation
  - surface features
  - trafficability

## OVERLAYS

- placed over a color-coded background display
- 3 colors used for overlays
- overlay features such as:
  - roads (primary, secondary)
  - railroads
  - obstacles
  - force positions
  - intervisibility

## CONTOURING

- clever algorithms tried and scrapped
- simple algorithm
  1. for each point, round value to nearest band
  2. if any of 8 neighbors of different band, shade as contour

## Propagation of Visibility

Circles are grid locations with elevation numbers ins  
 Top equations are expected height for point to be v  
 d= equations compute new delta to propagate  
 Thick lines go to visible locations

# ROUTE PLANNING

- Usual paradigm is "dynamic programming"

1. create a cost function for node traversal

$$\text{e.g. cost} = b (\text{height}_{\text{new}} - \text{height}_{\text{old}}) + c (\text{distance}_{\text{new-old}})$$

2. compute costs to neighboring nodes

3. propagate minimum cost

## ANALYSIS OF DYNAMIC PROGRAMMING

- Advantages:      easy to program  
                    finds optimal route
- Disadvantages:    uniform cost for simple or hard tasks  
                    cost function is non-intuitive,  
                    inexplicable
- TPL does not see tradeoffs
  - TPL does not see close second routes
  - TPL trusts others for tradeoff formula

## EXPERTISE

- prefer shortest lines to destination
- roads are likely routes
- when terrain changes ("obstacle"), compare going around it ("avoidance") to going through it
- laws of refraction (optics)

## OPTICS LAWS IN ROUTE PLANNING

$$\sin \theta = \frac{S0}{S1}$$

optimal angle to depart road is computable

## ROUTE PLANNING SHORTCUTS

- precompute some routes
- lump together common features into regions
- work interactively with TPL
- directed searching
- progressively refine from clusters of points down

“ accept plausible routes (do not require optimal)

## PROBLEMS AND SOLUTIONS

- ARTBAS tape has data anomalies
  - . let them be
  - . remove by filtering or by hand
  
- ARTBAS tape is unique, unsupported, unavailable for other areas
  - . switch to supported tape
  - . keep system suitable for other tape, but use ARTBAS

- Roads dominate Fulda Gap - distort optimal algorithms
  - . build system as is
  - . build system which also works if roads removed or only primary roads exist
  
- Symbolics hardware is barely fast enough for graphics
  - . this is prototype demo
  - . better hardware continues to evolve

## FUTURE MILESTONES

- compute and display possible routes of friend and foe
- compute and display probable masking and concealment
- identify and display possible hull defilade positions
- compute and display potential intercept points
- compute and display points to command angular sector of fire

**TASK 1E: DEVELOP AND FABRICATE DEMONSTRATOR**

**DEVELOPMENT ENVIRONMENT**

- › SYMBOLICS 3670
- › SYMBOLICS COLOR GRAPHIC SYSTEM
- › LASER GRAPHIC PRINTER
- › VOTAN VOICE RECOGNITION/GENERATION  
SYSTEM
- › PROGRAMMABLE DISPLAY PUSHBUTTON (PDP)  
SWITCHES
- › BEETLE CURSOR CONTROLLER

## **SYMBOLICS 3670 SOFTWARE ENVIRONMENT**

- ZETALISP LANGUAGE**
- FLAVORS EXTENSION**
- WINDOW SYSTEM**
- REAL-TIME EDITOR**
- INSPECTOR UTILITY**
- FONT EDITOR**
- E-MAIL CAPABILITY**
- ADVANCED NETWORKING CAPABILITY**
- FORTRAN 77 COMPILER**

## **SYMBOLICS 3670 HARDWARE**

- 4 MBYTES HIGH-SPEED RAM**
- 474 MBYTE WINCHESTER DISK**
- 45 MBYTE STREAMER TAPE**
- FLOATING POINT ACCELERATOR**
- 4 RS-232 SERIAL PORTS**
- 10 MBIT/SEC ETHERNET INTERFACE**
- HIGH RES (1100 X 900 BIT MAPPED)  
MONOCHROME MONITOR W/KEYBOARD  
AND MOUSE**

## **SYMBOLICS COLOR GRAPHICS SYSTEM**

- › 2 MILLION PIXEL MEMORY
- › 8 BITS/PIXEL
- › 2 BILLION COLORS (256 SIMULTANEOUS)
- › HARDWARE PAN AND ZOOM
- › PROGRAMMABLE VIDEO SIGNAL FORMAT
- › HIGH-RES (1280 X 1024) COLOR MONITOR

## **SYMBOLICS LASER GRAPHICS PRINTER**

- › **MINOLTA LASER ENGINE**
- › **10 PAGES/MINUTE (8.5 X 11)**
- › **240 X 240 DOTS PER INCH**
- › **BIT-MAPPED PRINT CAPABILITY**
- › **SERIAL (1000 BYTES/SEC) AND PARALLEL  
(30,000 BYTES/SEC) INTERFACES**

## **VOTAN VTR-6000 VOICE TERMINAL**

- › VOICE RECOGNITION/GENERATION CAPABILITY
- › ISOLATED OR CONTINUOUS  
SPEAKER-DEPENDENT RECOGNITION
- › LIMITED SPEAKER-INDEPENDENT RECOGNITION
- › 75 DOUBLE-TRAINED WORD CAPACITY  
ON-BOARD
- › UNLIMITED CAPACITY WITH VIRTUAL MEMORY  
SWAPPING
- › RS-232 INTERFACE

## **PROGRAMMABLE DISPLAY PUSHBUTTON (PDP) SWITCHES**

- › 16 X 35 INDIVIDUALLY ADDRESSABLE PIXEL  
ARRAY
- › 4 SWITCHES CONTROLLED BY A SINGLE  
RS-232 CARD
- › CONTROLLER HANDLES REFRESH, BLINKING,  
ASCII CHARACTER GENERATOR

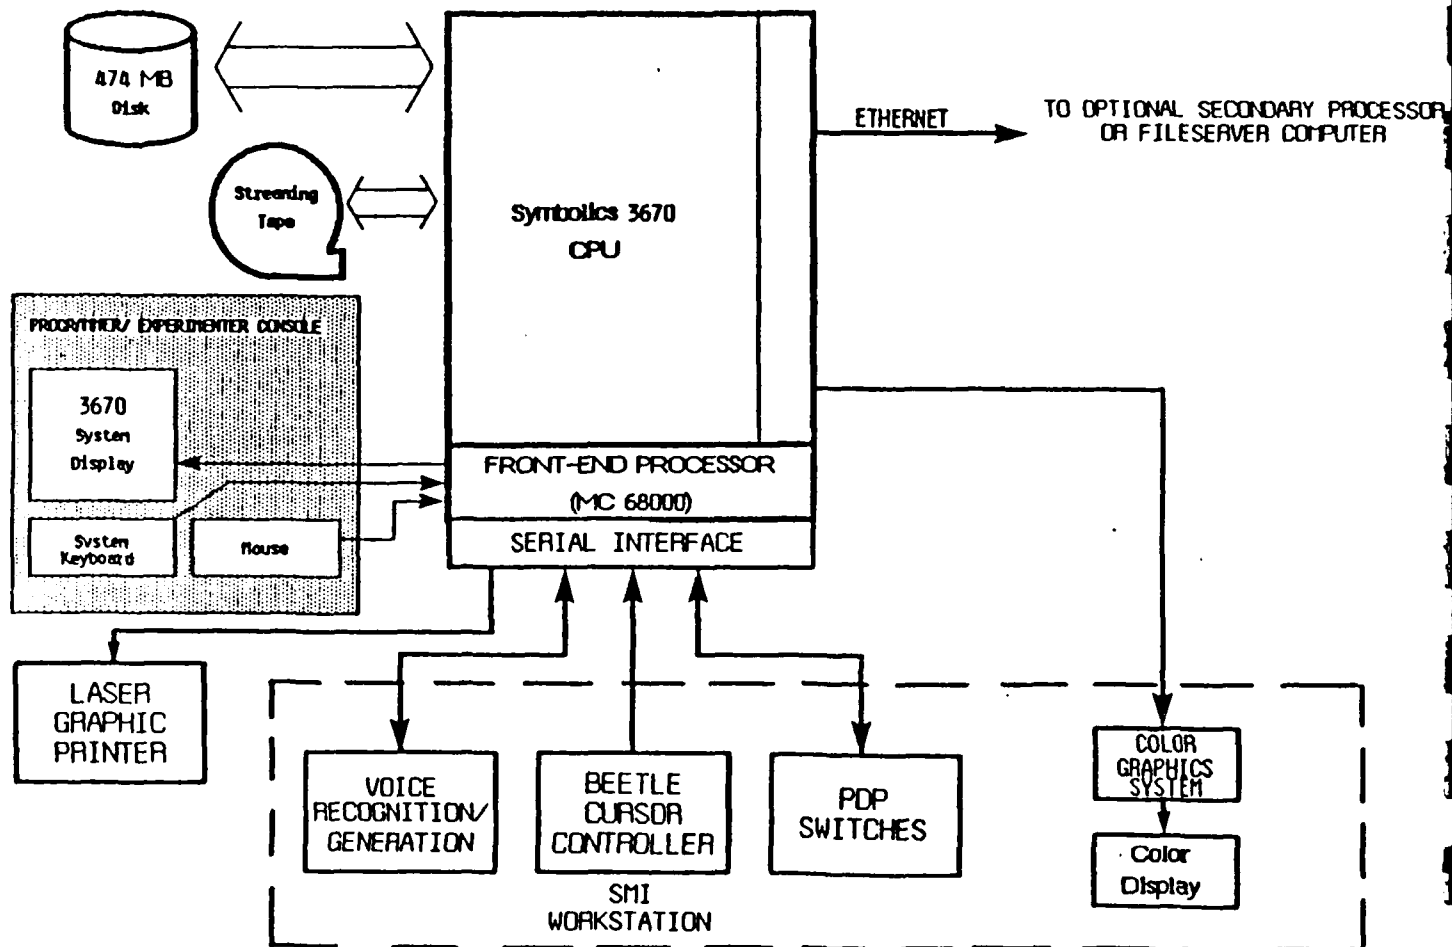

## **BEETLE CURSOR CONTROLLER**

- › INFINITE RESOLUTION (i.e. ANALOG)
- › INTERNAL FORCE TRANSDUCERS AND MICROPROCESSOR
- › VARIABLE SCALING FACTOR
- › UP TO FOUR SOFT SWITCHES

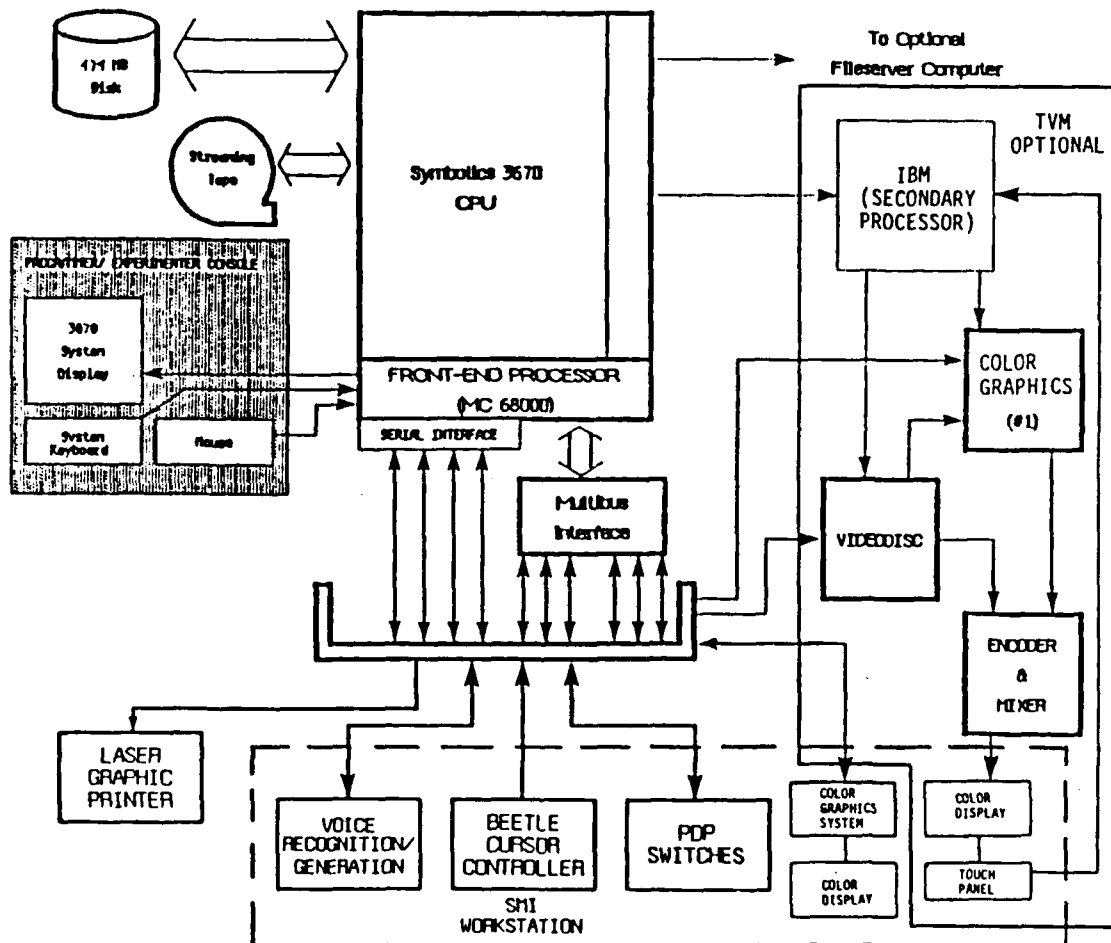

## **SUBSYSTEM INTEGRATION**

- VOICE RECOGNITION SUBSYSTEM INTEGRATED WITH SYMBOLICS
- PDP "SOFT" SWITCHES INTEGRATED WITH SYMBOLICS
- BETTLE CURSOR CONTROLLER INTEGRATED WITH SYMBOLICS
- DEMO SCENARIO FOR DEC 4 CONSISTS OF:
  - AMBUSH OPERATION SEQUENCE
  - VOICE INPUT / GENERATION
  - PDP SWITCH INTERACTION (GRAPHIC ICON AND FLASHING TEXT)
  - CONTROL INPUTS FROM BEETLE
  - TEXTUAL DISPLAYS TO SIMULATE DMA — GRAPHICS OUTPUT

## 2ND IPR BENCH DEMO ARCHITECTURE

# SMI SYSTEM ARCHITECTURE

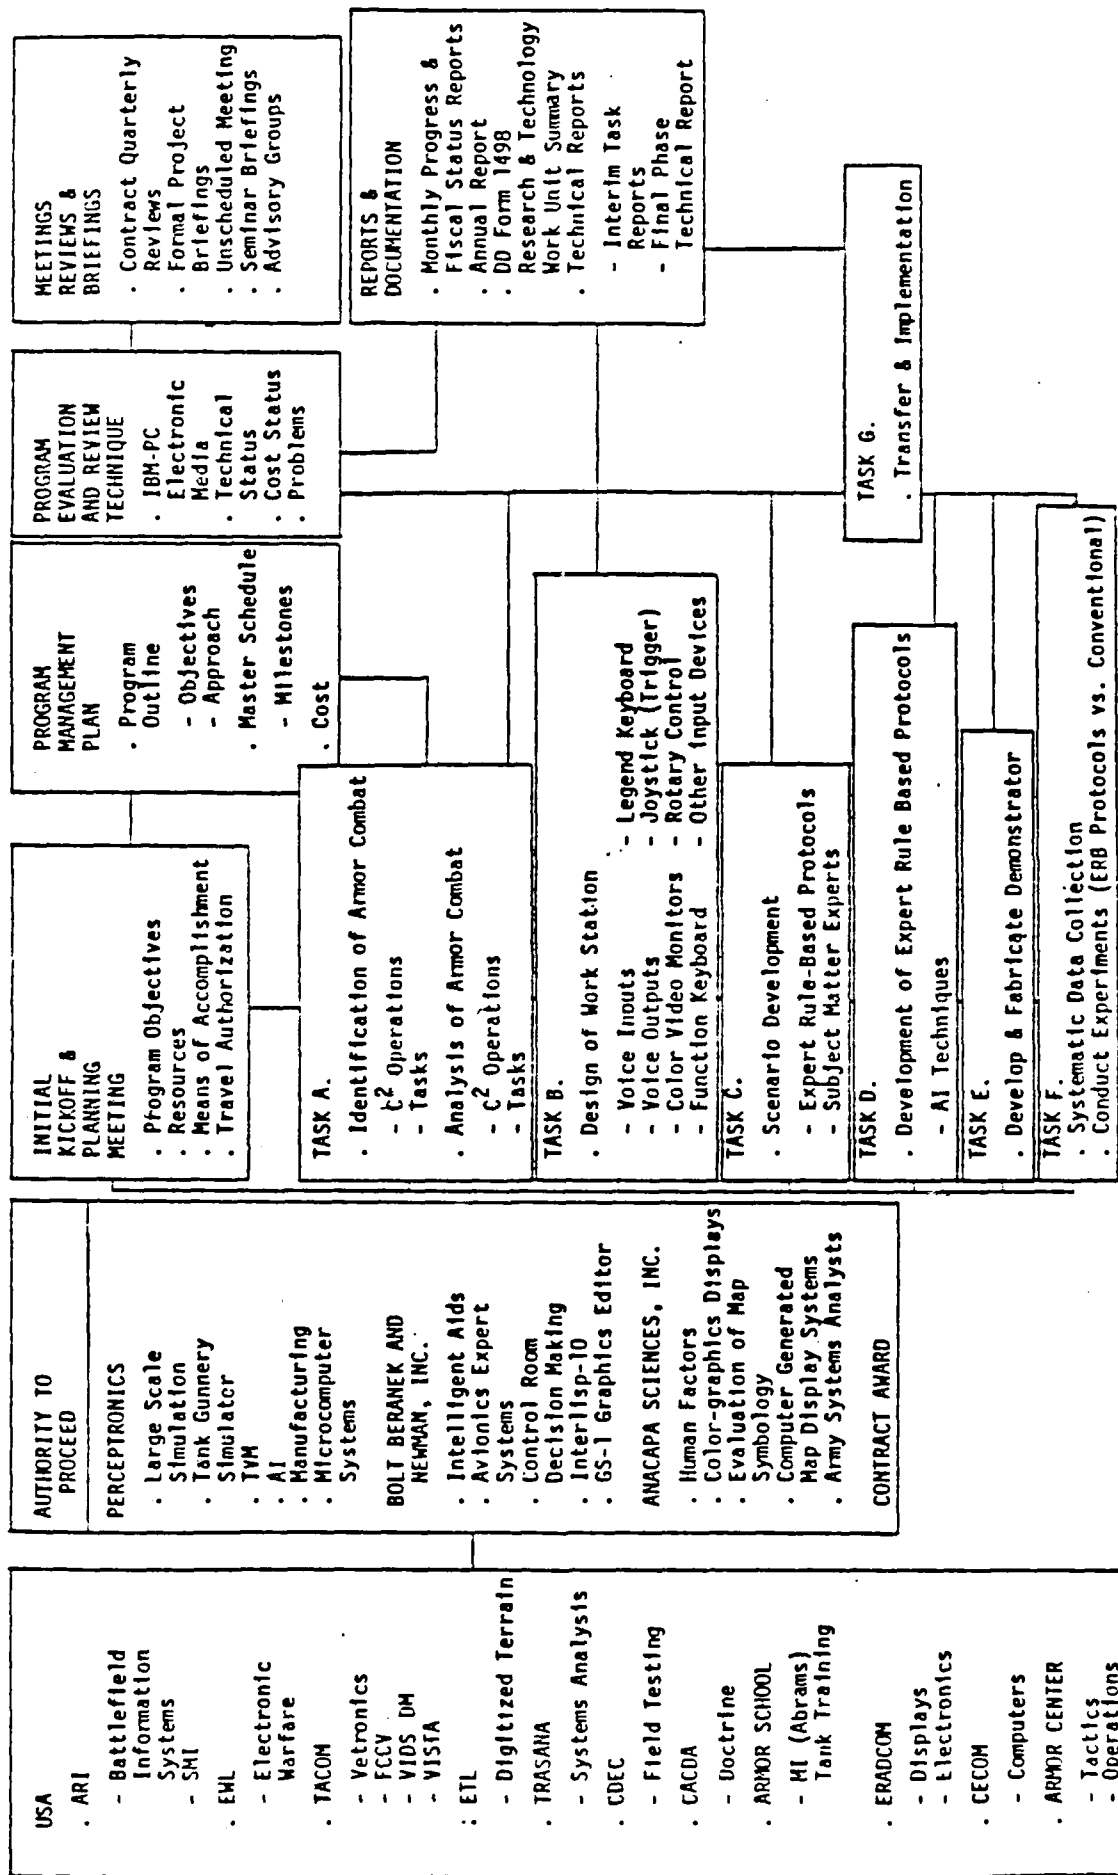

## TECHNICAL SUMMARY

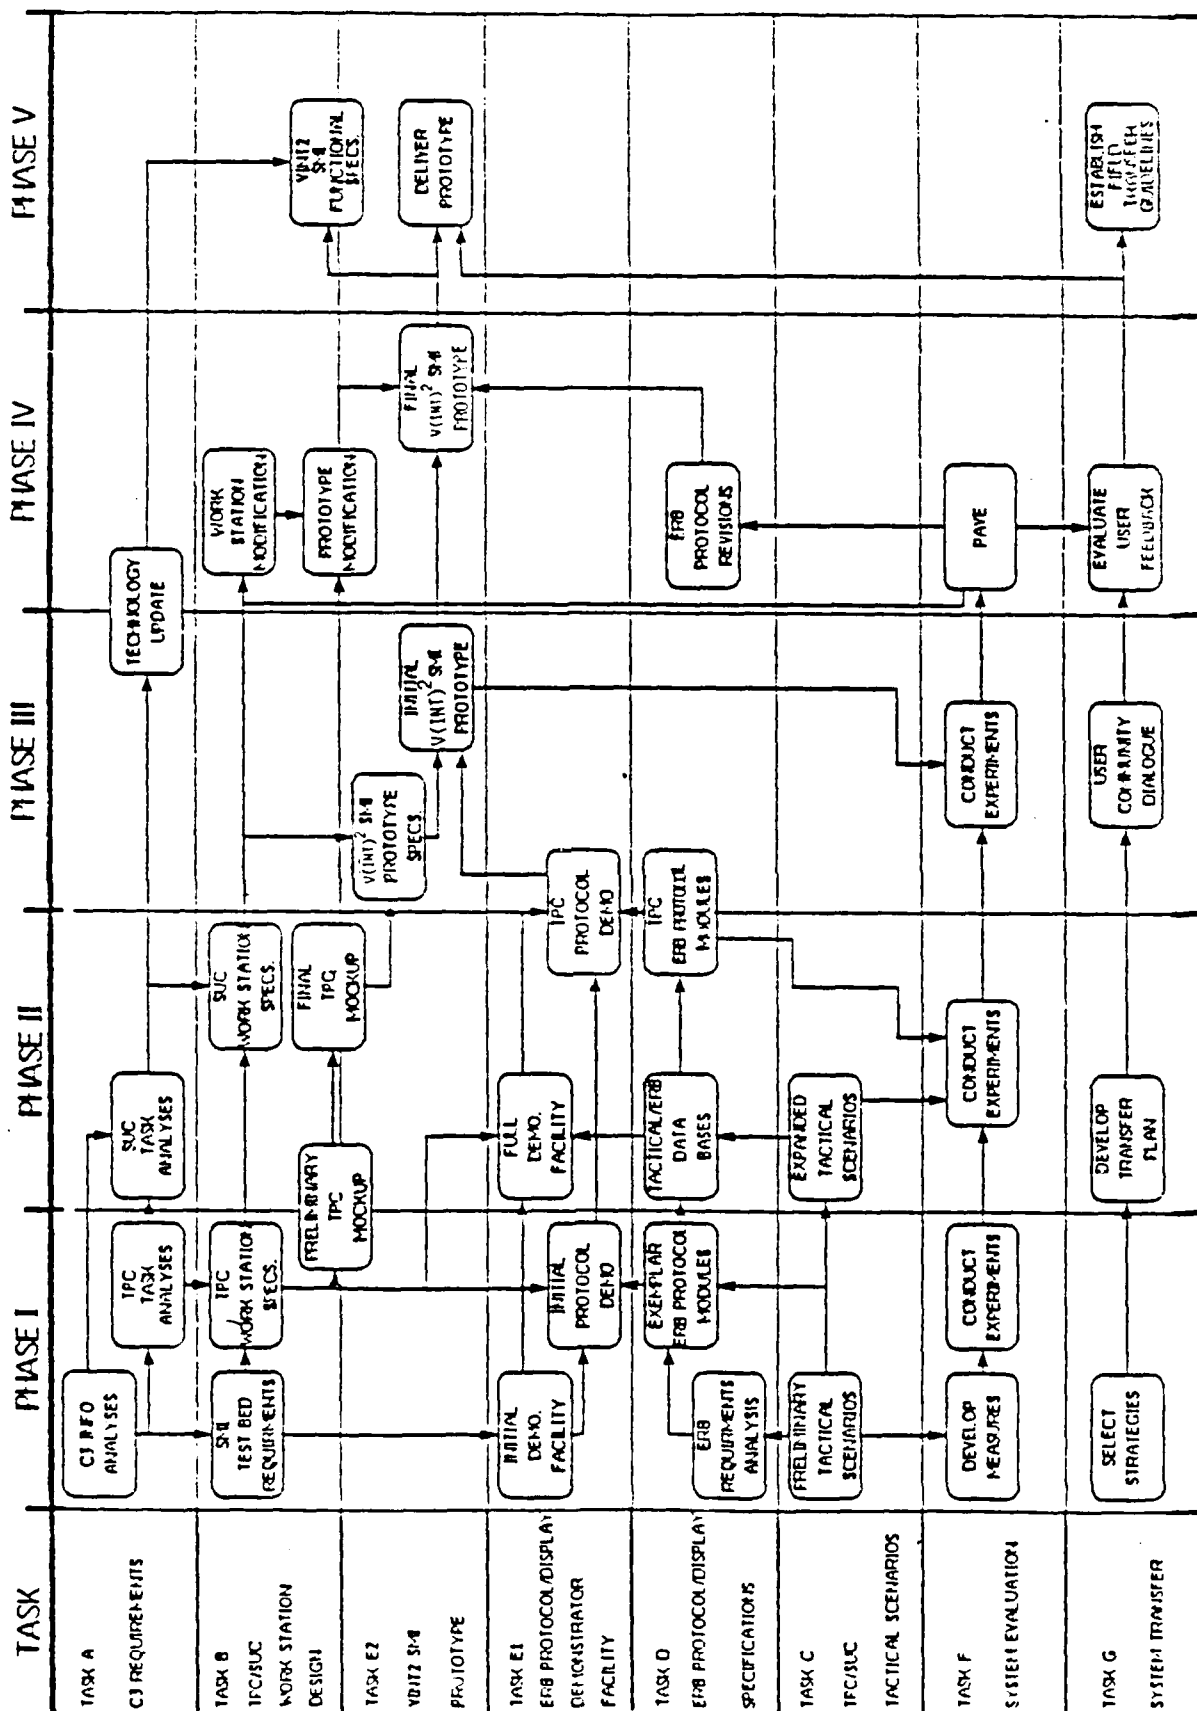

# PHASE I PROGRAM PLAN

# STAGES IN V(INT)2 SMI PROTOTYPE DEVELOPMENT

# V(INT)2 SMI MAIN PROJECT MILESTONES

## V(INT)<sup>2</sup> OPERATIONAL CONCERNS

- FUTURE LOOKING
  - OFF-LOAD COMMANDER/USER
    1. VOICE ENTRY VIA ICS
    2. STATUS BY EXCEPTION
    3. ALERTS—PROVIDE PARSED MESSAGE AND AUTOMATICALLY UPDATE UNDERLYING GRAPHICS
    4. INTEGRATE SPEED, TRAFFICABILITY, ENEMY ACTIONS TO GRAPHICS
    5. AUTOMATICALLY UPDATE CHANGES, E.G., SPEED
    6. INTEGRATE COVER, CONCEALMENT, MASKING, NOISE RADIATION FANS, ETC, TO GRAPHICS
    7. PRESENT BEST AMBUSH SITE—ONLY EXPAND OUT UPON SPECIFIC TPL REQUEST
    8. ALLOW FOR REAL-TIME IMAGE DISPLAY, E.G.S, FROM RPV's OWN/UNIT RETICLES

## FUTURE WORK

- TASK IA
  - FINAL REFINEMENT OF CONTROLS AND DISPLAYS FOR DEMO SCRIPT
  - HUMAN FACTOR ALL MMI
- TASK IB
  - IDENTIFY ALL CONTROLS AND DISPLAYS FOR FUTURE INTEGRATION INTO WORK STATION "MOCK-UP"
- TASK IC
  - RECONCILE AMBUSH OPERATIONS SCENARIO TO THE "BIG PICTURE" AND PROGRAM V(INT)<sup>2</sup> SMI EXECUTIVE GEARED TO DEMO SCENARIO
- TASK ID
  - DEVELOP AND PROGRAM "AGREED UPON" ERB PROTOCOLS FOR DEMO SCENARIO
  - INTEGRATE ERB PROTOCOL SOFTWARE WITH V(INT)<sup>2</sup> SMI EXECUTIVE
- TASK IE
  - INTEGRATE DEMO SOFTWARE WITH ALL CONTROLS AND DISPLAYS
  - FINALIZE "BENCH SYSTEM" FOR PHASE I DEMO
- TASK IF
  - IDENTIFY INITIAL PERFORMANCE MEASURES
  - CONDUCT DEMO EVALUATION (PILOT EXPERIMENTS)
- TASK IG
  - MAINTAIN USER COMMUNITY INVOLVEMENT / PREPARE USER COMMUNITY FOR PHASE I DEMO "MESSAGE"?
